

National Lumber Announces the New Installed Insulation Division

Having the right specialists on your team can keep a project running smoothly as they apply their specialized experience to your building project. Just as you have traditionally subcontracted work to a trusted plumber as part of your team, you now have the option of subcontracting insulation work with **National Lumber's new Installed Insulation Division.**

National Lumber's insulation experts provide Guardian Fiberglass Insulation with an experienced team of installers. While new to National Lumber, the team has years of experience together in this area. This is their specialty and the team works thoroughly and efficiently — keeping projects on schedule.

Building code compliance and OSHA safety compliance are met when you hire National Lumber's Installed Insulation team. They have all the proper safety and work equipment. Most importantly, they are up-to-date on meeting codes for energy efficiency and current building standards.

Check out the slideshow on the National Lumber website showing the team at work. You'll see their attention to detail as they locate and fill potential leak areas with foam insulation and then install batts & rolls of fiberglass insulation. Get a peek at their methods as they systematically work around plumbing and wiring to guarantee all areas are covered.

The team is now also offering Guardian Blown-In Fiberglass Insulation. The fiberglass insulation is sprayed into a wall cavity, completely filling in around pipes, wires, electrical outlets and other objects, significantly reducing voids and air gaps, resulting in high R-values. We'll soon be adding pictures of this process to our website for your reference.

The team will leave your jobsite clean and ready for your next phase of construction.

Call today to discuss your project insulation needs. Then you can decide if it's cost-effective to subcontract this work and leave yourself free to work on other items.
